# Challenges and Solutions for

## Steelmaking Dust Valorization in the Green Steel Transition

Bernhard Voraberger, Christoph Prietl, Pastucha Krzysztof, Gerald Wimmer

30.10.2024

European Steel Technology Platform

*20 years together*

voestalpine

ONE STEP AHEAD.

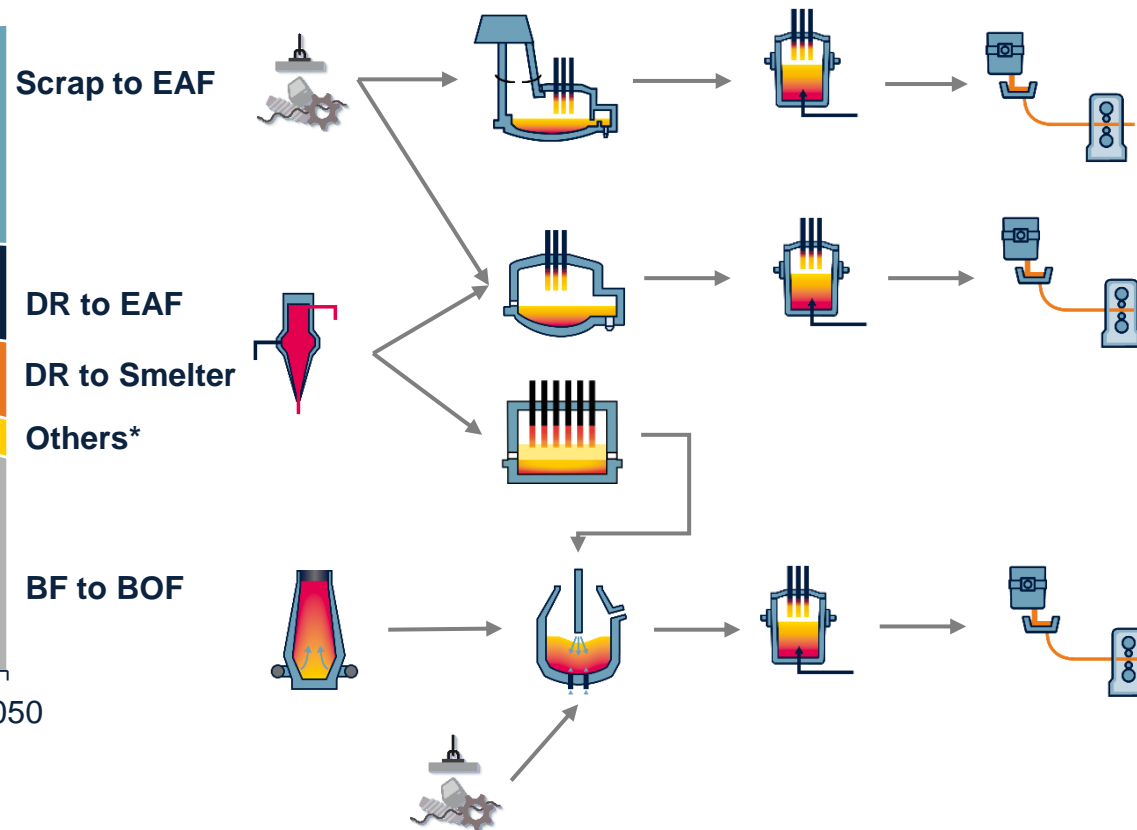

# Green Steel transition

Forecast steel production, million tons p.a.

\* includes coal based DRI, Induction furnace, Corex/Finex, open-hearth furnaces

## Challenges due to green steel transition?

- BF share will decrease
  - Lower amount of BF slag and GBFS → cement industry is looking for alternatives
  - **Less sinter plants in operation → less option for internal recycling of scales, iron rich dusts and sludges**
- DR and EAF share will increase
  - High demand for green electric energy
  - Briquetting solution and recirculation of DR fines will be required
  - **Increased amount of EAF slags and dust to be expected → solution for recycling necessary**
  - **More scrap based EAF steelmaking and more galvanized scrap → higher Zn content in dust and until 2050 scrap based EAF steelmaking will increase to 750 Mtpa**
  - Cleaning and sorting of scrap will become more important → design scrap

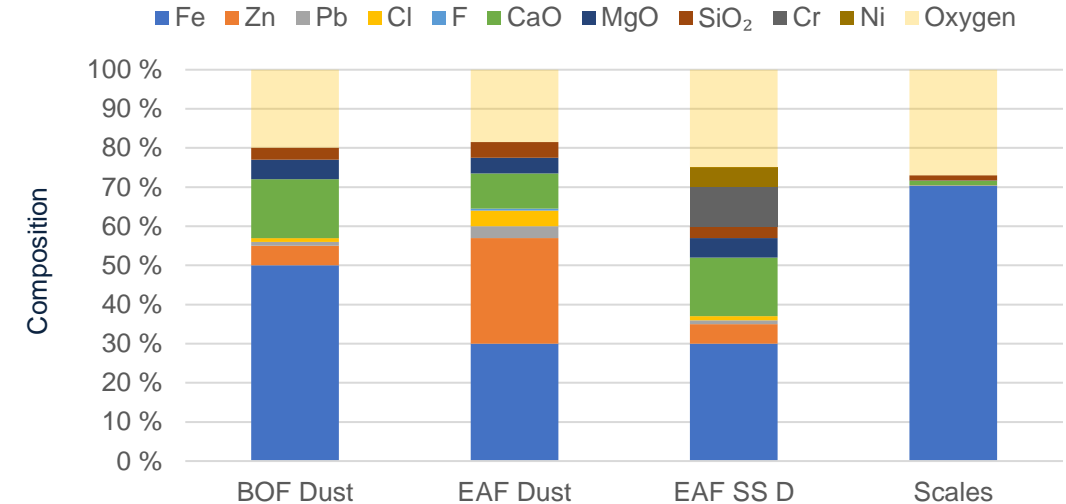

# Steel mill dust and current recycling

- Steel mill dust contains valuable elements: Zn, Fe, minerals
- Globally large amount of steel mill dust is produced:
  - BOF: 1,300 Mtpa steel → 30 Mtpa dust (2,3 %)
  - EAF: 500 Mtpa steel → 10 Mtpa (2 %)
- Less than 50 % of EAF dust is recycled globally
- In EU 90 % of EAF Dust is recycled with Waelz process (RKF)

## Issues with Waelz process:

- Mainly recover one metal (zinc)
- Generate a low-quality zinc oxide, needs washing
- Produce high amounts of residues (slag) which is not used
- Need centralized solutions to be effective
- Have High CO<sub>2</sub> emissions

Typical Dust composition

## External recycling:

RKF

## Internal Recycling:

Sinter

# Zinc Extraction Process (ZEP) – for high Zn content dust

## 2 step dust recycling solution for the recovery of iron and high-quality zinc

Input material:

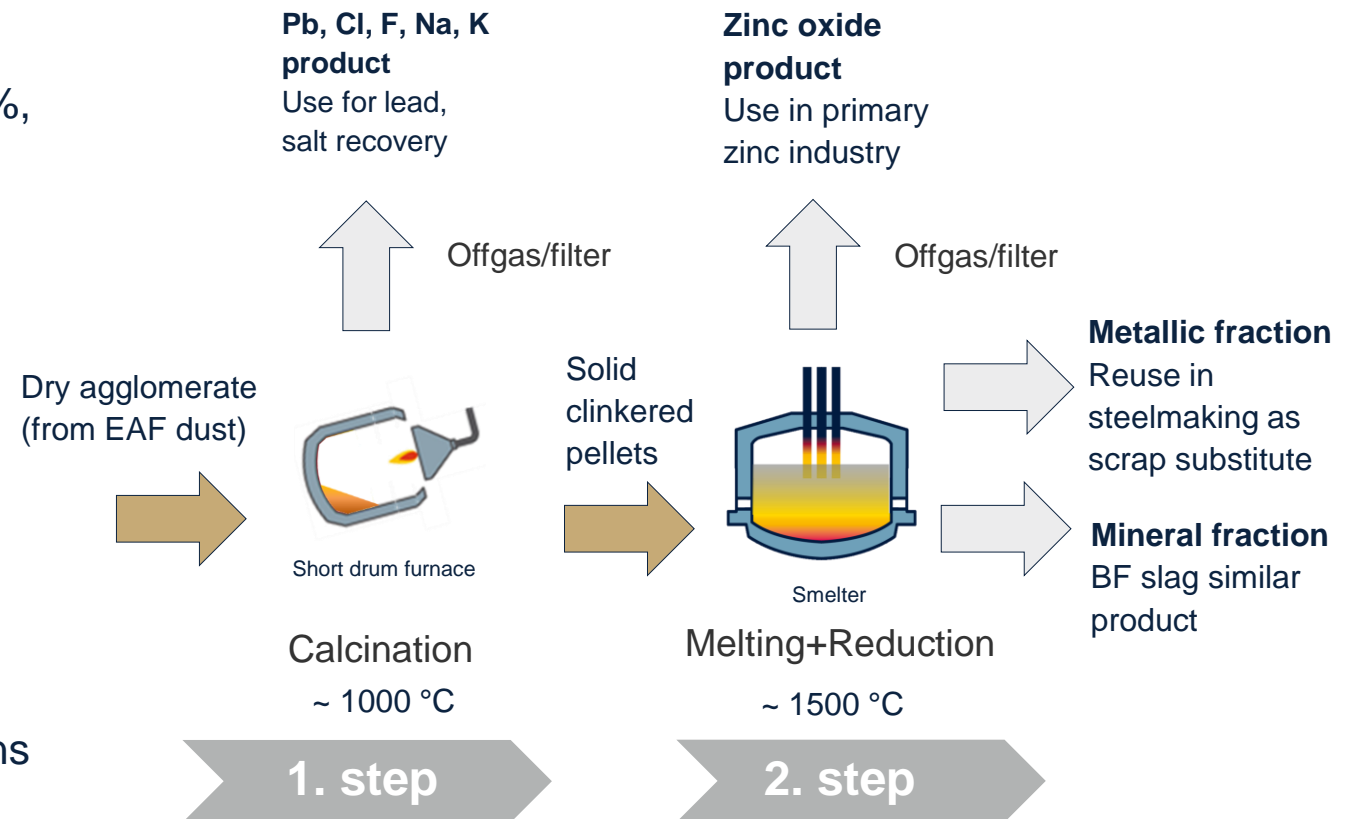

- Dry agglomerate prepared from EAF dust
- Scrap based EAF dust with high Zn content (Zn > 20 %, ZnO > 25 %)

Recycling process – combination of two plant units:

- Short drum furnace
- Melting & reduction unit

Output materials:

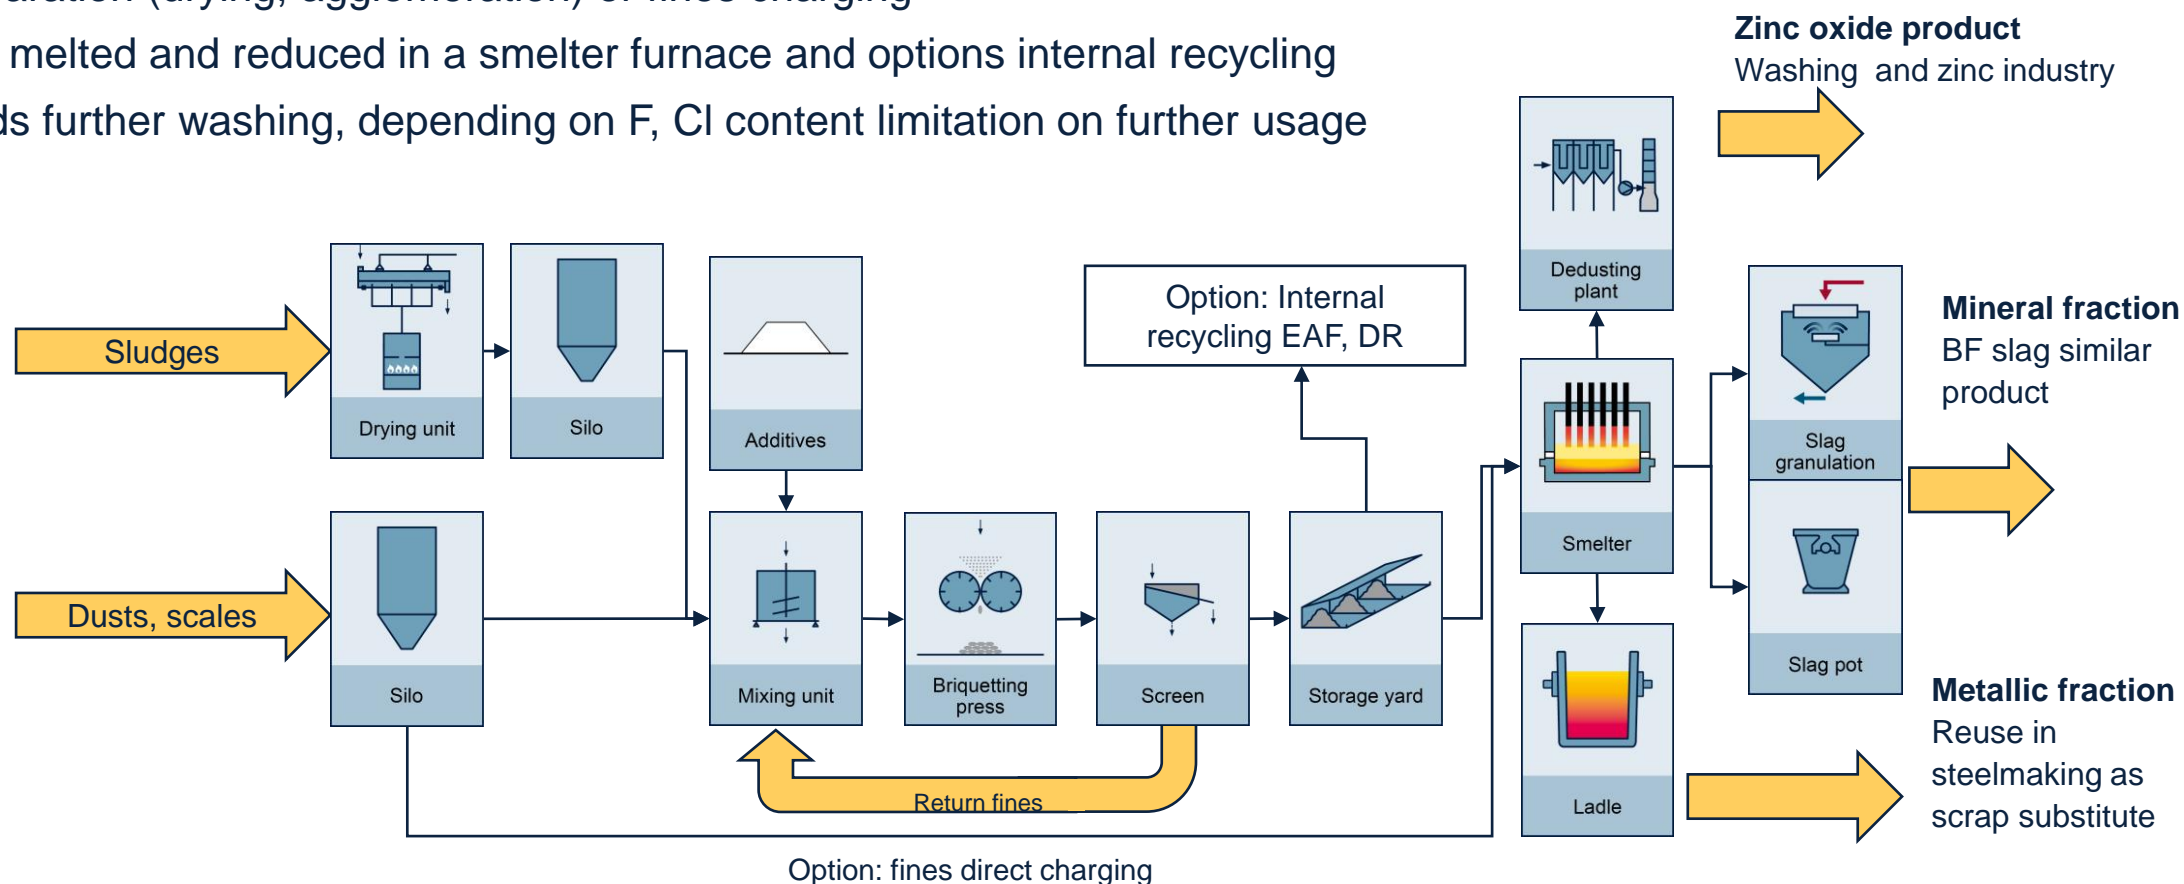

- 4 different output products, suitable for further use
- Halogen contamination is removed in 1. step  $\Rightarrow$  higher ZnO quality  $\Rightarrow$  direct usage in primary zinc industry
- Recovered iron/metal can be directly reused in steelmaking as scrap substitute  $\Rightarrow$  lower CO<sub>2</sub> emissions

## Zinc Extraction Process (ZEP) – for low Zn content dust

### 1 step dust recycling solution for the recovery of iron and zinc

- Input material: iron bearing dust with low Zn content:  $\text{Zn} < 10\%$  ( $\text{ZnO} < 13\%$ ), BOF, BF Dust, Scales
- Dust preparation (drying, agglomeration) or fines charging
- all dust is melted and reduced in a smelter furnace and options internal recycling
- ZnO needs further washing, depending on F, Cl content limitation on further usage

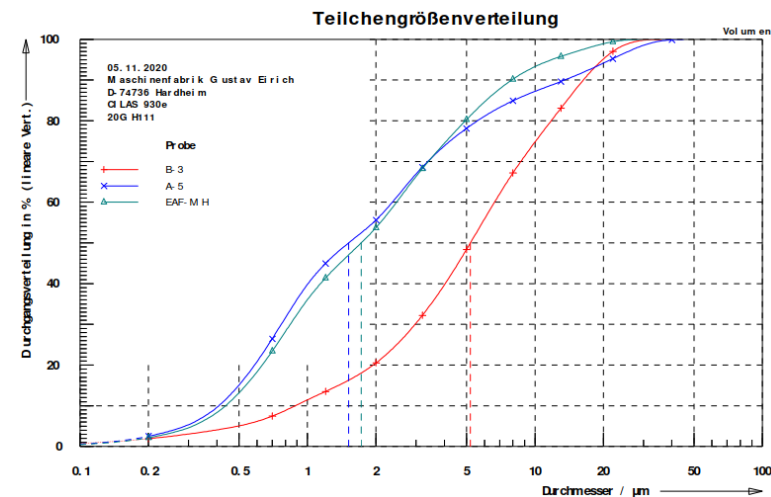

# Dust agglomeration

different options based on requirements and dust composition

EAF Dust:

- Grain size  $D_{90} \sim 15 \mu\text{m}$ ,  $D_{50}$  ca. 2 – 5  $\mu\text{m}$
- halogens in combination with  $\text{H}_2\text{O}$  improves the necessary binding forces → no / less binder
- Highest strength: pelletizing and briquetting

**Granulation**

**Extrusion**

**Pelletizing**

**Briquetting**

# 1. Step: calcination in short drum furnace

## Oxidizing treatment at 1000°C

### Lab scale testing

### Large scale testing

Mass [%]	Before	after
Cl	4,56	0,30
F	0,46	0,05
Pb	2,79	0,31
K	1,51	0,28

Evaporation of elements

### Prototype

Dust Input	27.000 t/a
bulk density	1,5 kg/dm <sup>3</sup>
Process time	5 h
Weight per batch	19,0 t
Output	3,9 t/h
Volume per batch	10,0 m <sup>3</sup>
Furnace volume	40,1 m <sup>3</sup>
Burner power	5,0 MW

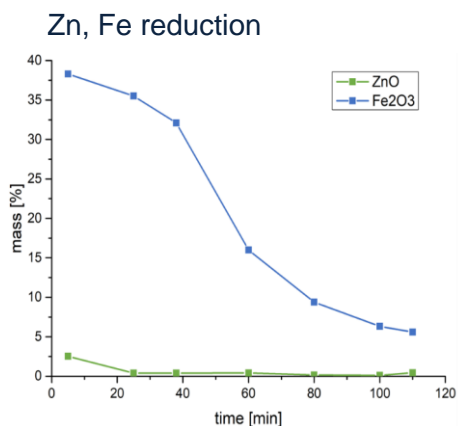

## 2. Step: melting and reduction in smelter furnace vaporization of Zn, separation of metal and slag

### Lab scale testing

ARP  60 kg, 2019

DC-EAF

### Large scale testing

Dust Capacity	27.000 t/a
Slag tapping	3 – 6 h
Metal tapping	5-10 h
Metal production	0,7-2 t/h
Furnace diameter	3,2 m
Coal injection lance	900 kg/h
Trafo Power	10 MVA

## Products for EAF dust

100 % EAF dust	33 % Zinc oxide	29 % Metal	26 % Slag	12 % Lead chloride

# Zinc oxide product comparison (wt %)

Waelz Oxid *\*(after leaching)*

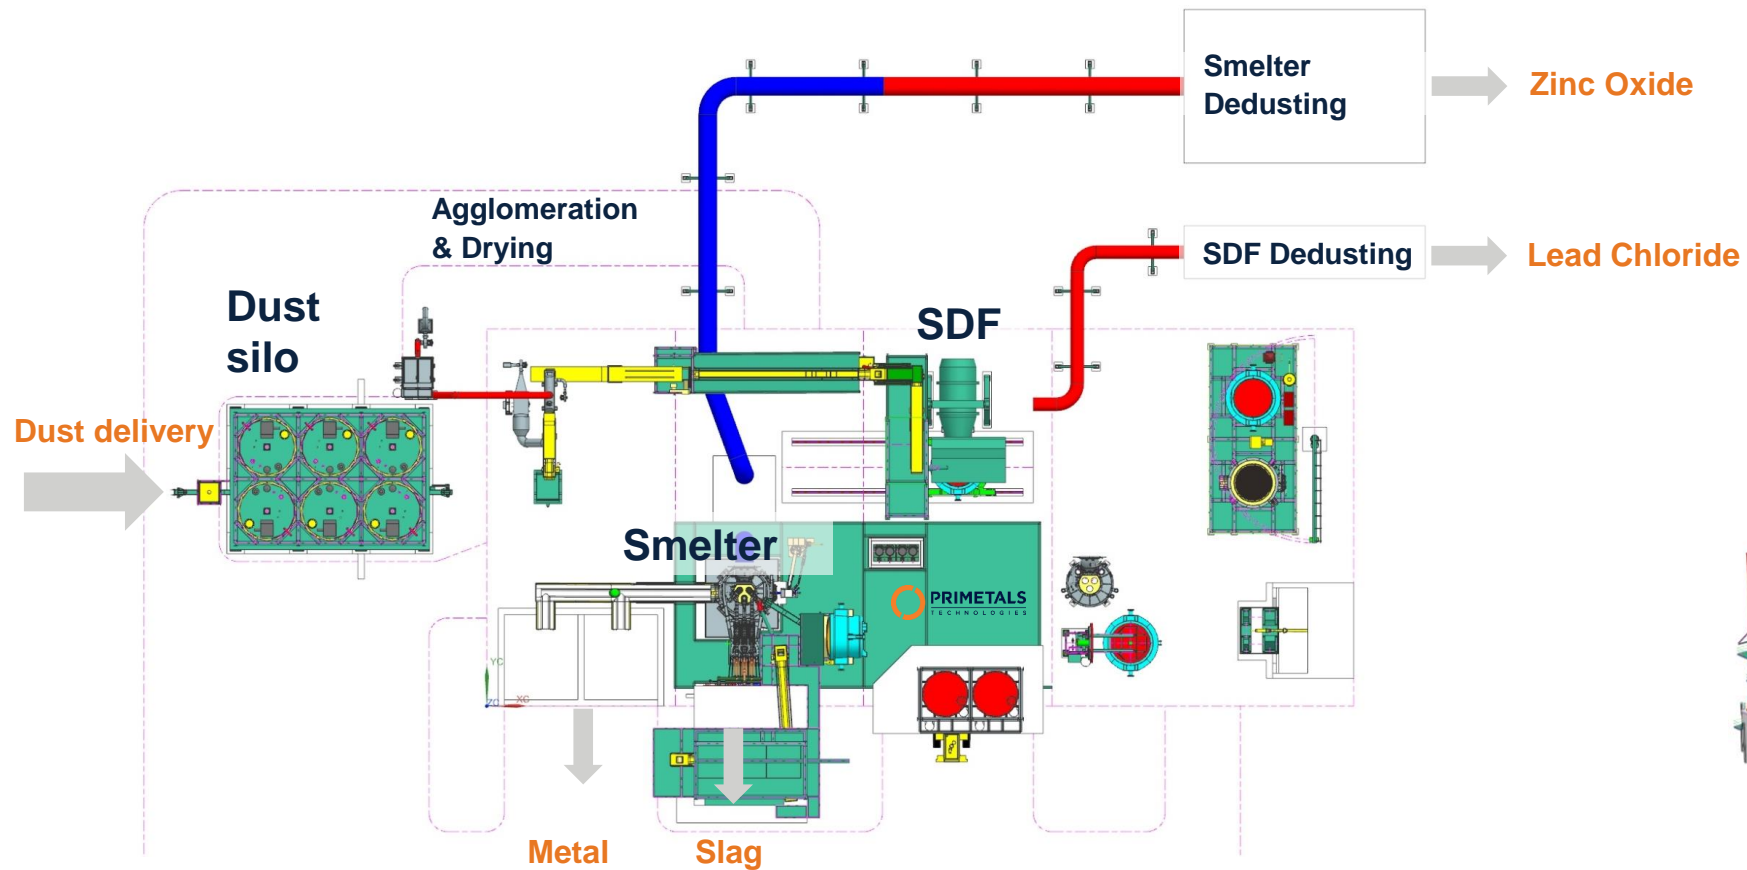

ZEP ZnO Product

- F, Cl need to be very lower for electrowinning, heavy metals need to be removed
- With ZEP process clean zinc oxide can be produced without washing
- Much higher Zn content and therefore higher yield with ZEP

## Plant design, Capacity 30.000 t/year

Space requirement: 2100 m<sup>2</sup> for building, total area around 5000 m<sup>2</sup>

## Waelz process

**Mainly large central units ~ 120 ktpa**

Washing necessary and F will remain → **lower Zn Quality**

**Continuous process**

~ 90 % market share on EAF dust recycling

**By products need to be landfilled** (large amount of solid slag generated, > 60 % dust input)

**Lower Zn recovery > 90 %**

**High CO<sub>2</sub> emissions**

vs.

## ZEP

**Smaller Decentral or central unit (less transportation) ~ 20 – 60 ktpa**

Cl, F, Pb removed in first step → **high Zn Quality**, no washing

semi continuous process (**batch wise**)

**Reuse of metallic product** in steel making (dilution due to S content)

**Reuse of mineral product** for road construction (liquid slag generated which can be modified)

**Higher Zn recovery > 96 %**

**Option to be CO<sub>2</sub> neutral with green electricity and H<sub>2</sub> for burner**

# Consumption figures & CO<sub>2</sub> emission

## ZEP / ZEP green

Carbon: 156 kg/t per ton input

Carbon only for reduction of Zn and Fe, Zep green with 80 % biochar and H<sub>2</sub> burner

Electrical energy

1723 | 2649 kWh/t dust, 5414 | 8324 kWh/t Zn

CO<sub>2</sub> emission (grid factor 80 g/kWh)

839 | 331 kg/t dust, 2638 | 1040 kg/t Zn

## Waelz process

Carbon: 200 kg/t input EU (270 kg/t in USA)

Carbon for heating and Zn reduction, autothermal process

Limited usage of Biochar due to higher reactivity

Electrical energy

352 kWh/t dust, 1592 kWh/t Zn

CO<sub>2</sub> emission (grid factor 80 g/kWh)

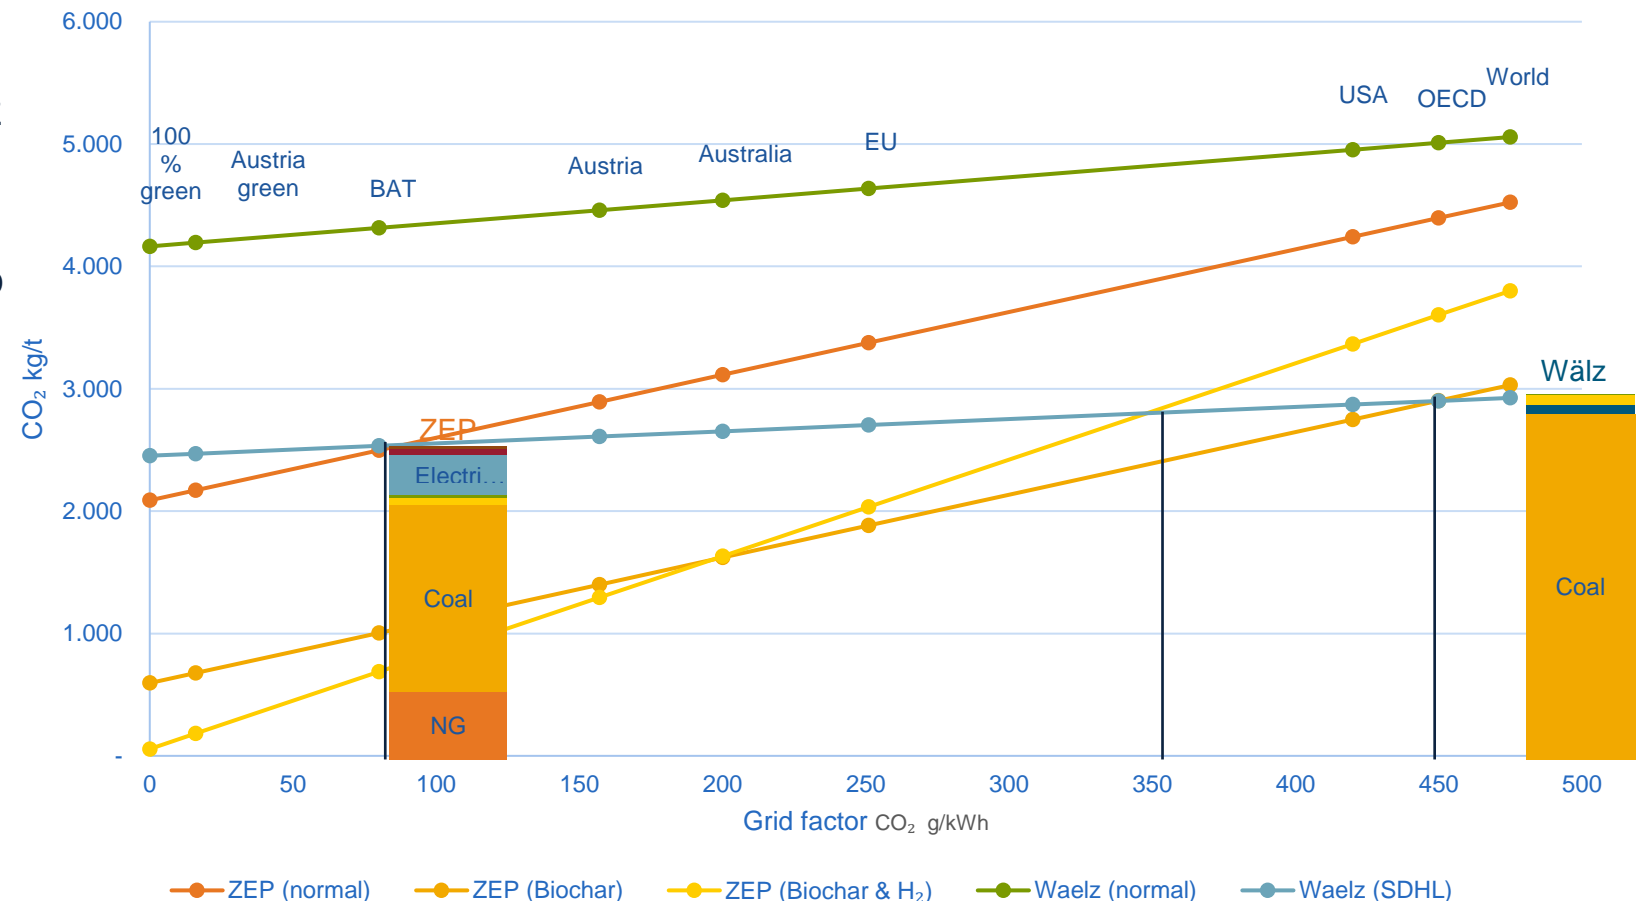

949 kg/t dust, 4291 kg/t Zn in EU (SDHL)

# CO<sub>2</sub> Emissions

- For green electric energy (< 80 g CO<sub>2</sub>/kWh) ZEP process will have lower CO<sub>2</sub> emission than Waelz process
- With the use of biochar as reducing agent break even will be increased to above 350 g CO<sub>2</sub>/kWh
- With the use of H<sub>2</sub> burner even further
- Utilization of biochar in Waelz process challenging due to higher reactivity → more limitation than in Smelter furnace

Carbon dioxide emissions based on different grid factors for Zn product (excl. electrowinning)

# Conclusion

## Green transition challenge

- Scrap and EAF share in steelmaking will increase → more Zn dust
- Less internal recycling options with ongoing green steel transformation → alternative to sinter plant required

## Current recycling processes like Waelz process have limitations:

- < 20 % of ZnO produced can be used in primary zinc industry due to contamination with halogens (F, Cl, etc.)
- > 60 % of solid iron rich slag is generated which need to be land filled
- High CO<sub>2</sub> emissions

## New ZEP process offers zero waste solution for iron and zinc containing dust:

- Flexible: for high as well as low Zn containing dust
- Clean: Halogen, lead contamination is removed in 1. step → higher ZnO quality (no washing)
- Circular: Less amount of liquid slag is generated which can be modified in smelter for further usage in construction
- Circular: Iron and metal fraction is recovered and can be directly reused in steelmaking as scrap substitute
- Green: lower CO<sub>2</sub> emissions with renewable electric energy
- Process development has been finalized and successfully proven, Industrial scale plant in planing
