Valorization of EAF slags from DRI melting with dry granulation process

Marta Guzzon - Tenova

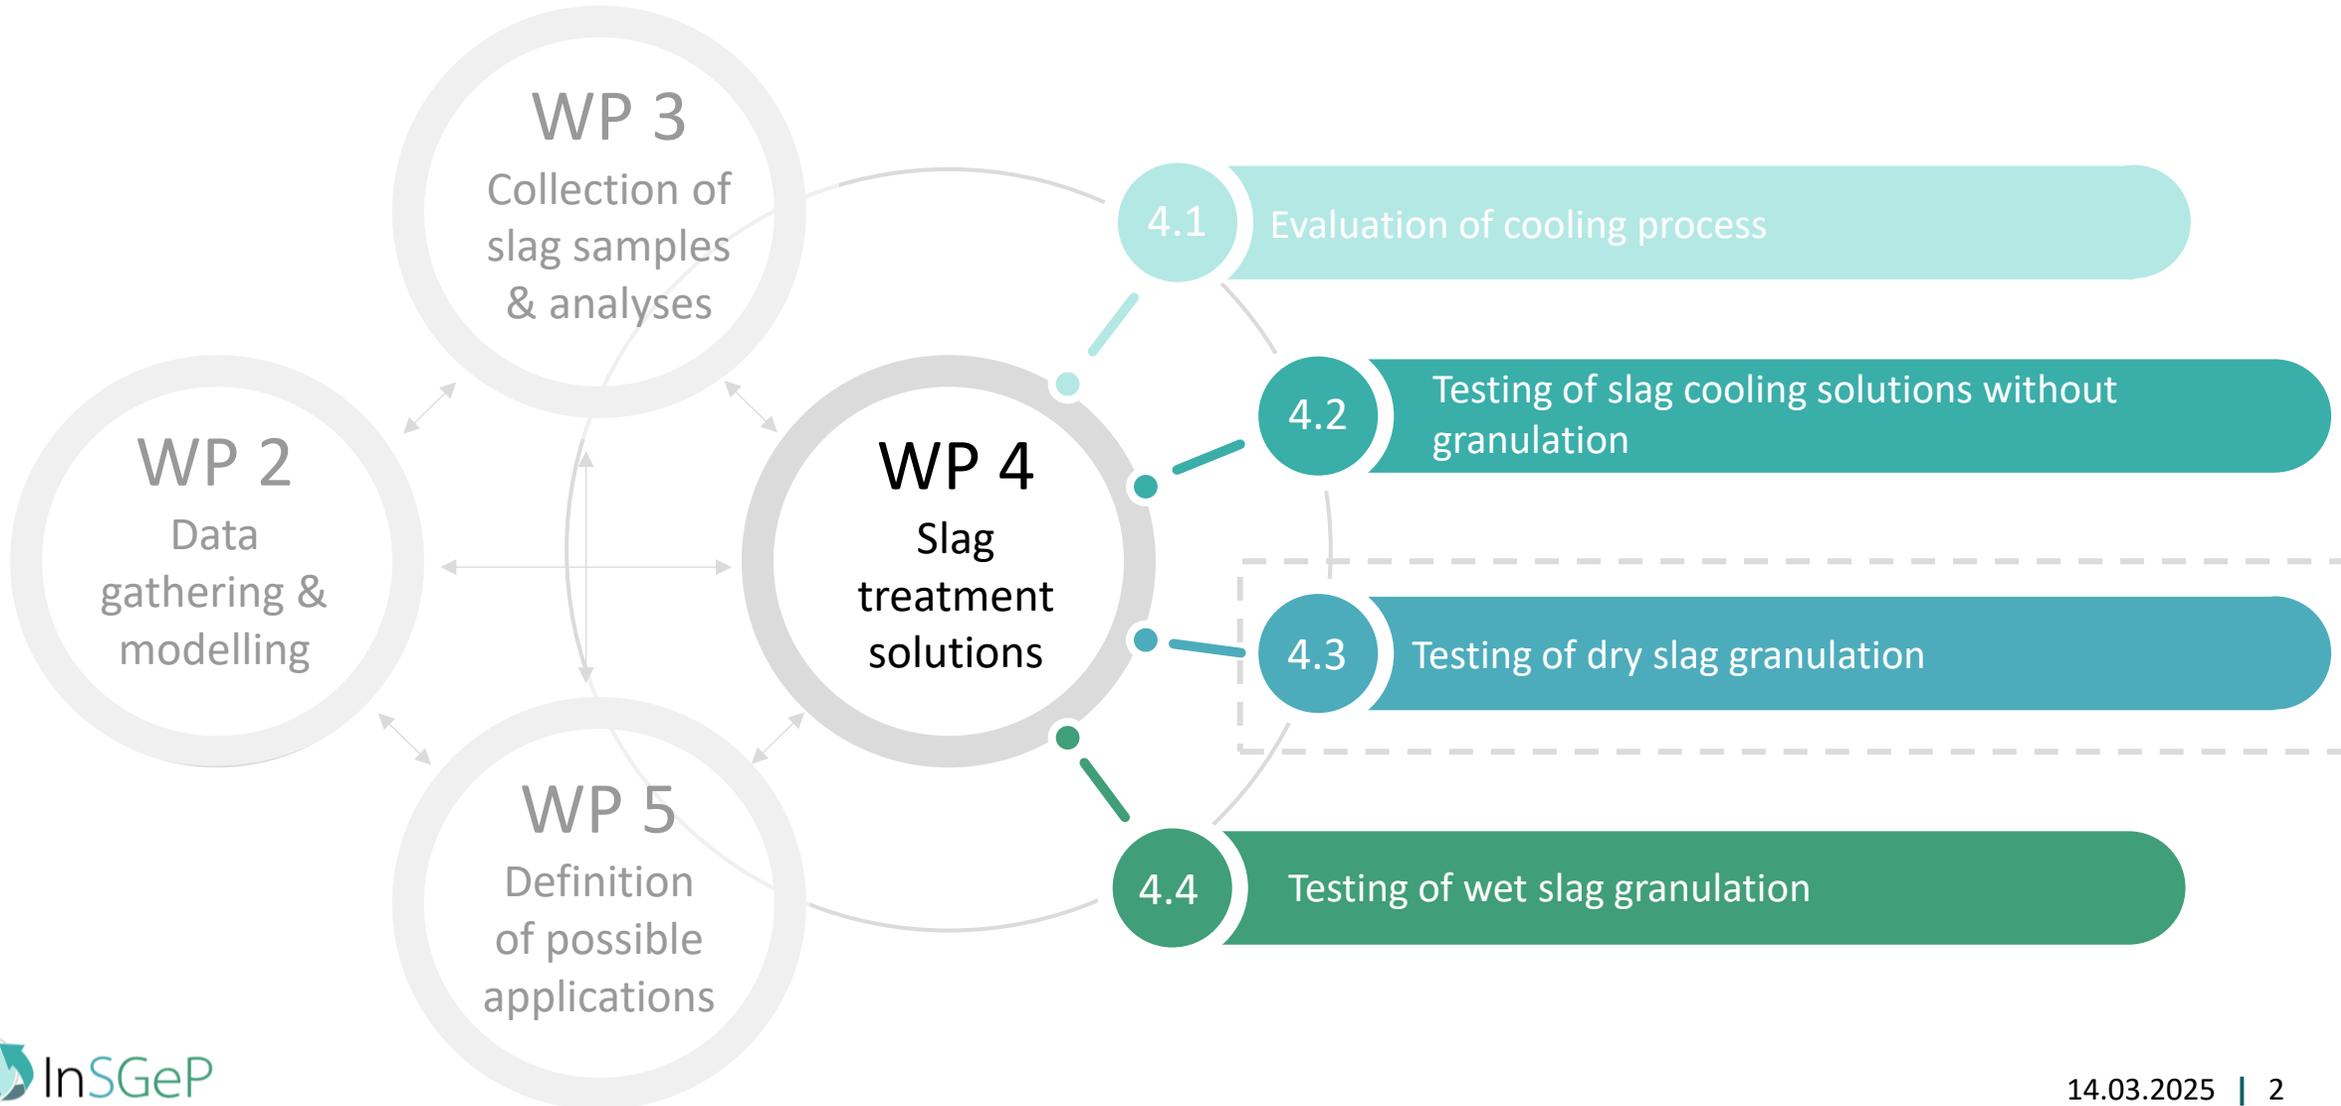

05/03/2025

Event title

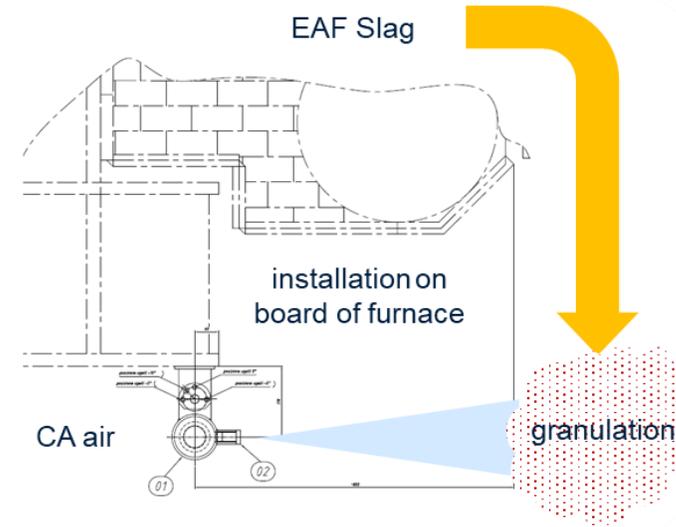

The research leading to these results has received funding from the European Union's Research Fund for Coal and Steel research programme under grant agreement number: 101112665

WP4 – Slag Treatment Solutions

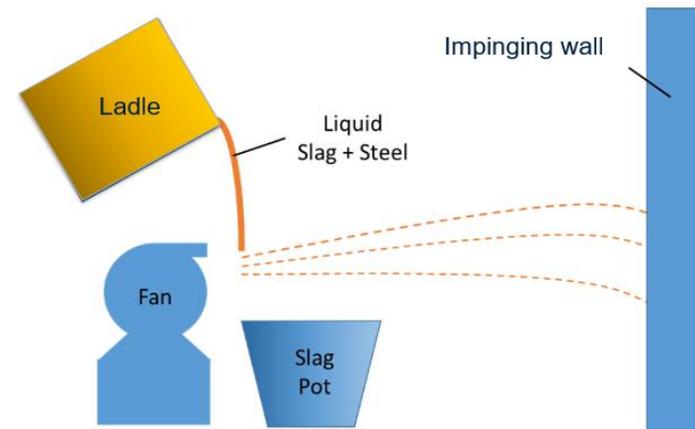

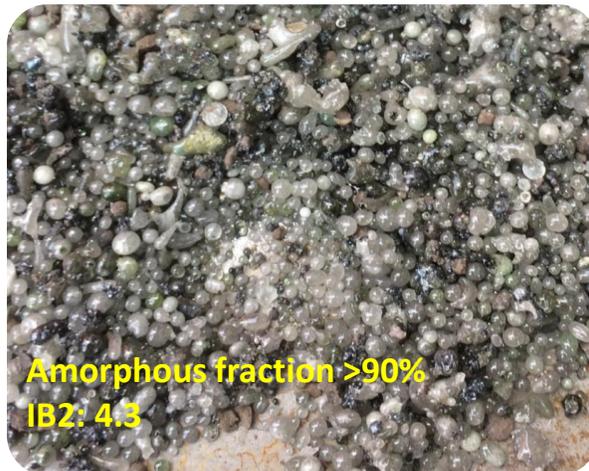

Tenova Dry Slag Granulation

On Line: EAF slag directly in the pit

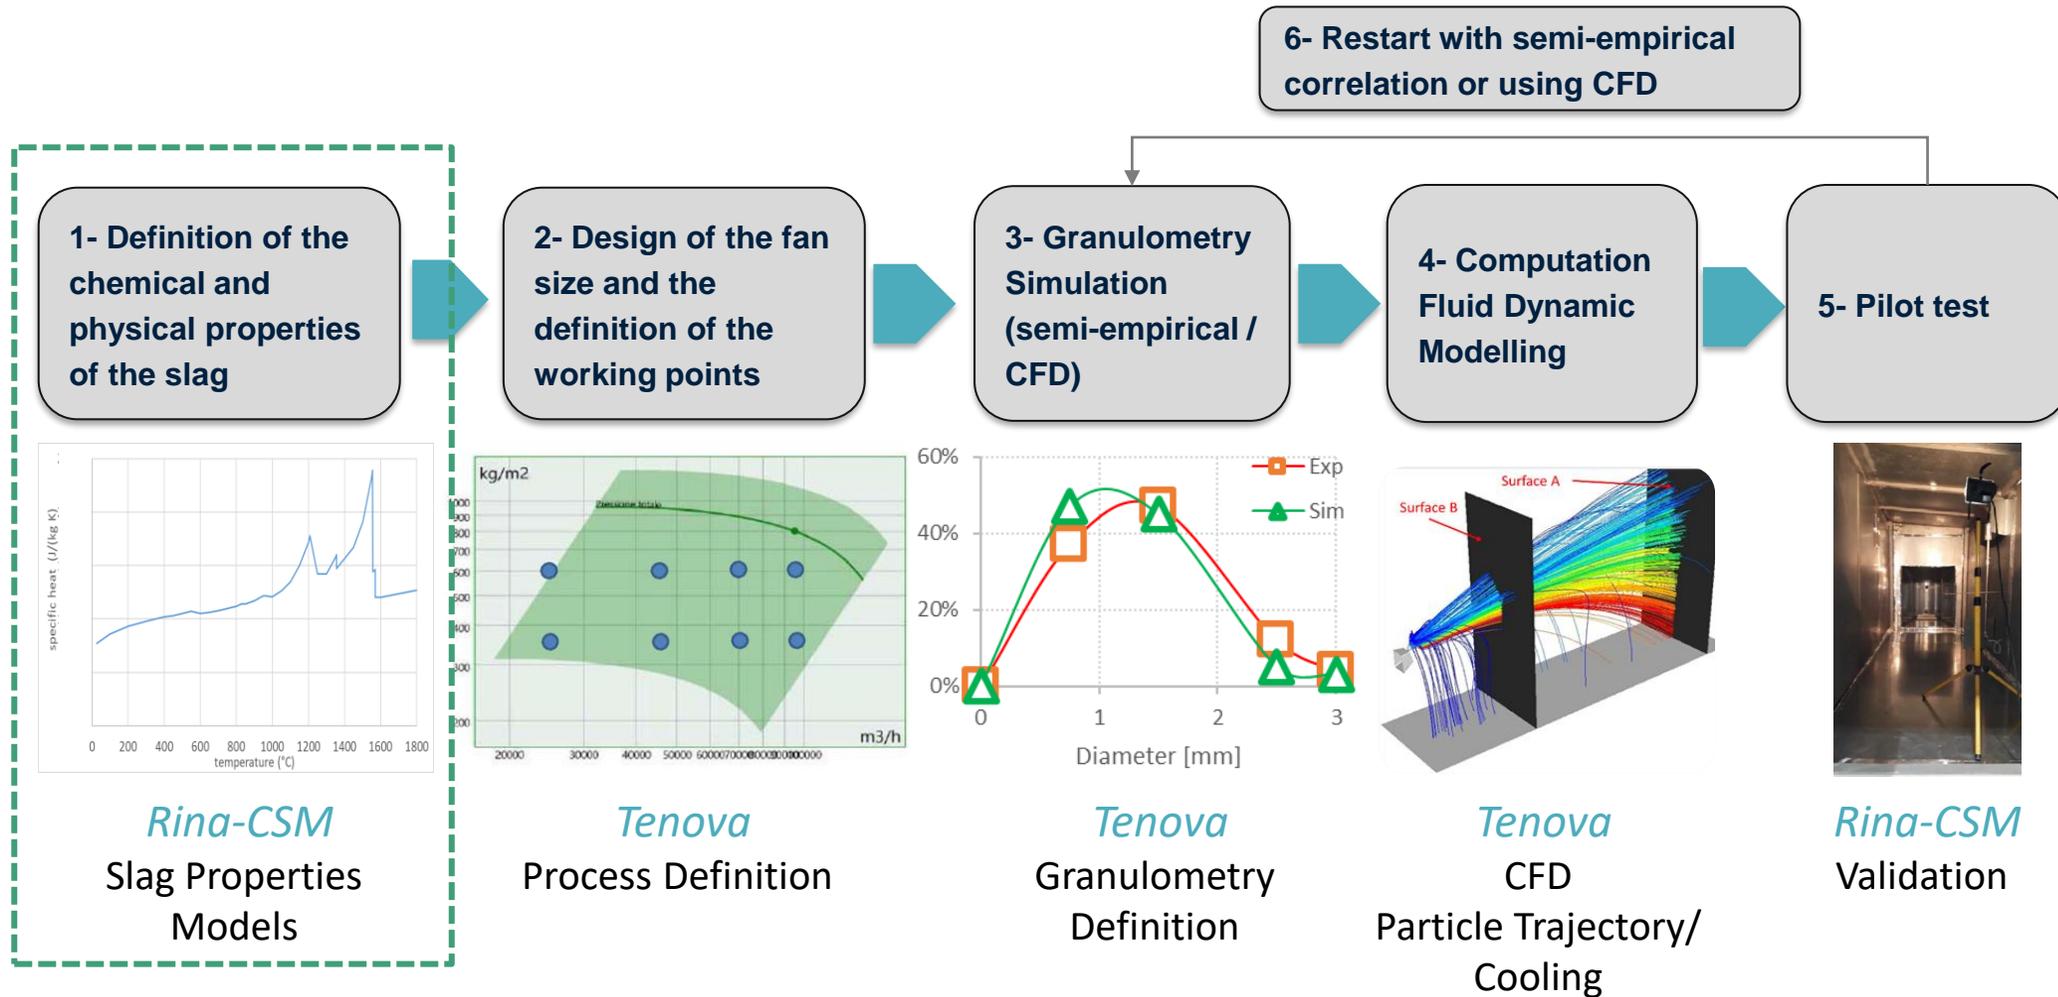

Type	Industrial
Application	On Line
Slag	EAF Slag
Slag Flow Rate	variable

Off-Line: EAF slag in slag pot and LF slag in ladle

Type	Pilot
Application	Off line
Slag	LF Slag + steel*
Slag Flow rate	Controlled (constant)

Tenova Dry Slag Granulation Modelling

Slag properties

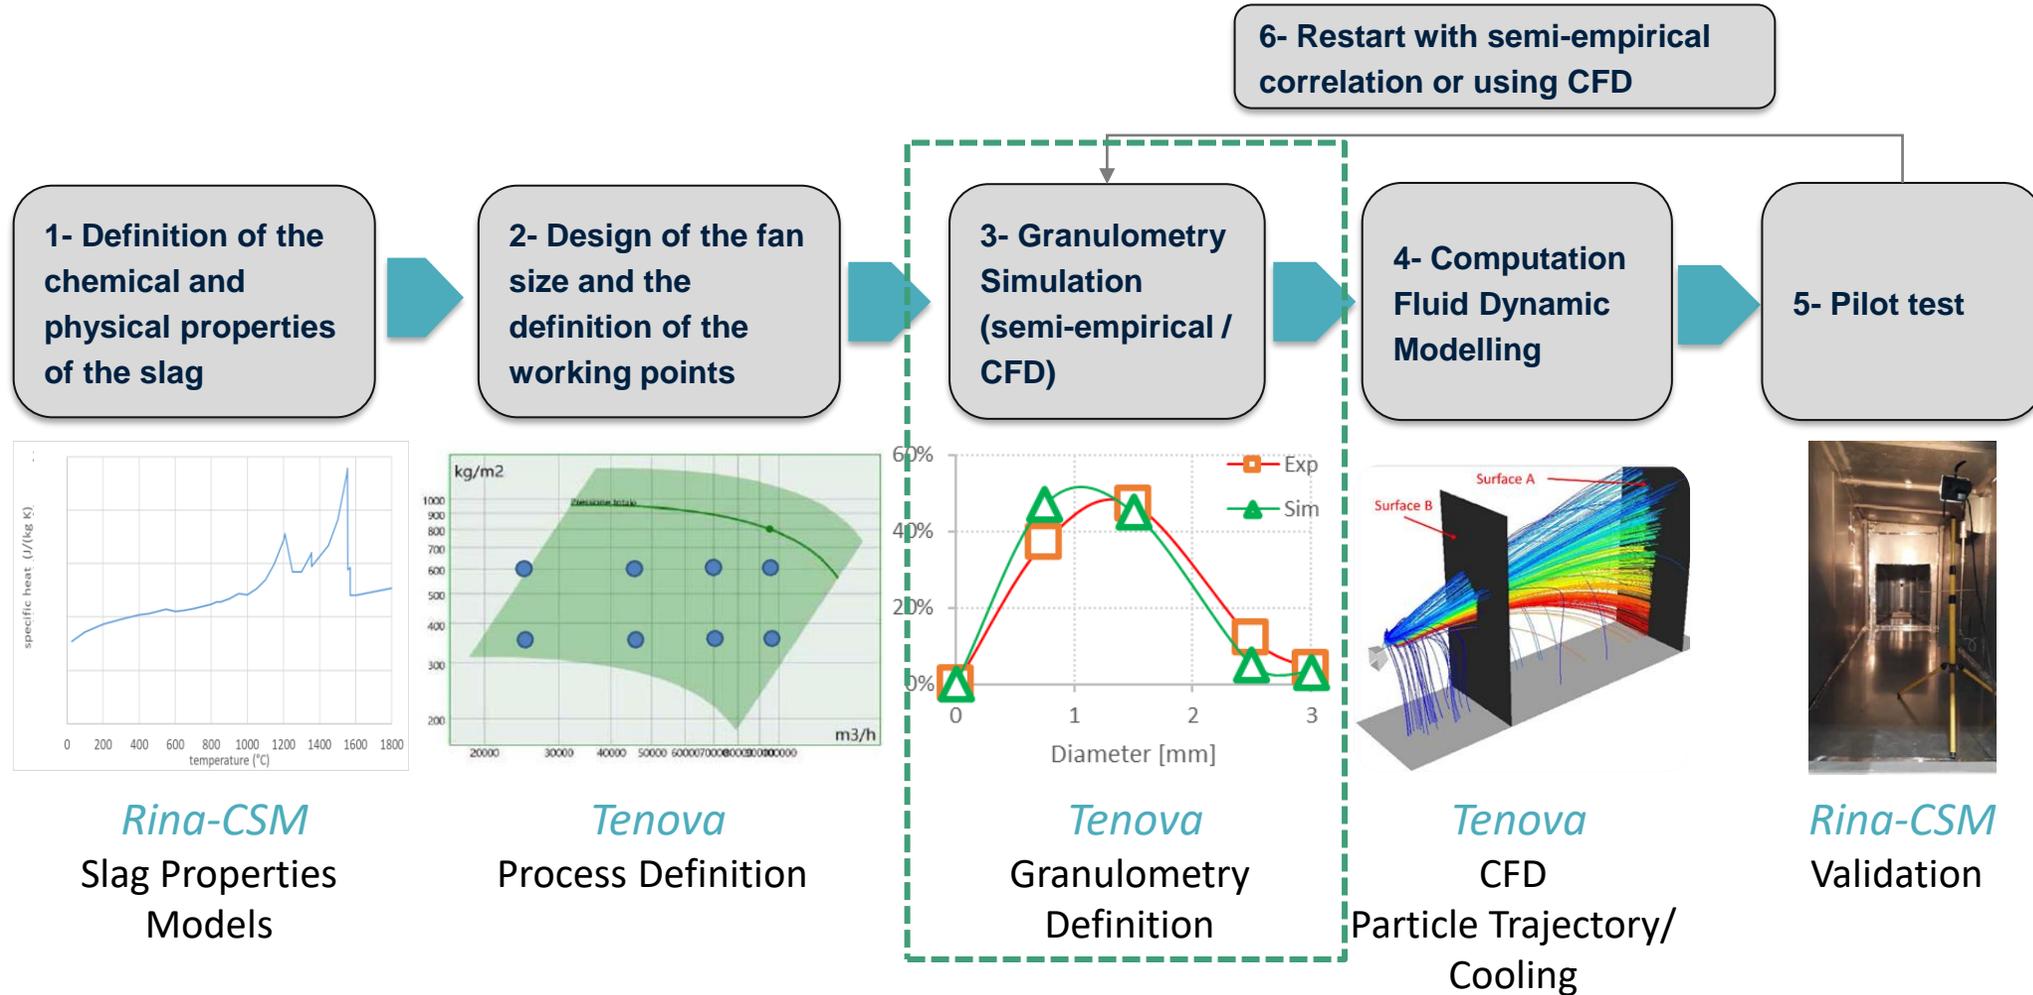

Slag properties given by CSM:

100% DRI FEED		SLAG COMPOSITION	
Chemical compound	% WEIGHT	Species	% WEIGHT
Fetot.	84.4	SiO ₂	18.7
Al ₂ O ₃	1	TiO ₂	1.3
CaO	1.2	CaO	37.1
MgO	0.7	MgO	6.9
SiO ₂	4.7	FeO	24.1
ZnO	0.03	MnO	1.6
S	0.01	Al ₂ O ₃	9.4
C	3.3	Na ₂ O	0.5
Metallization	95.5	K ₂ O	0.2

100% DRI

Temperature	1550 °C
Density @T	3081 Kg/m ³
Surface tension @T	0.539 N/m
Viscosity @T	0.0261 Pa*s
Thermal conductivity @T	0.08 W/m/K
Specific heat @T	1401 J/kg/K

Tenova Dry Slag Granulation Modelling

Model setup

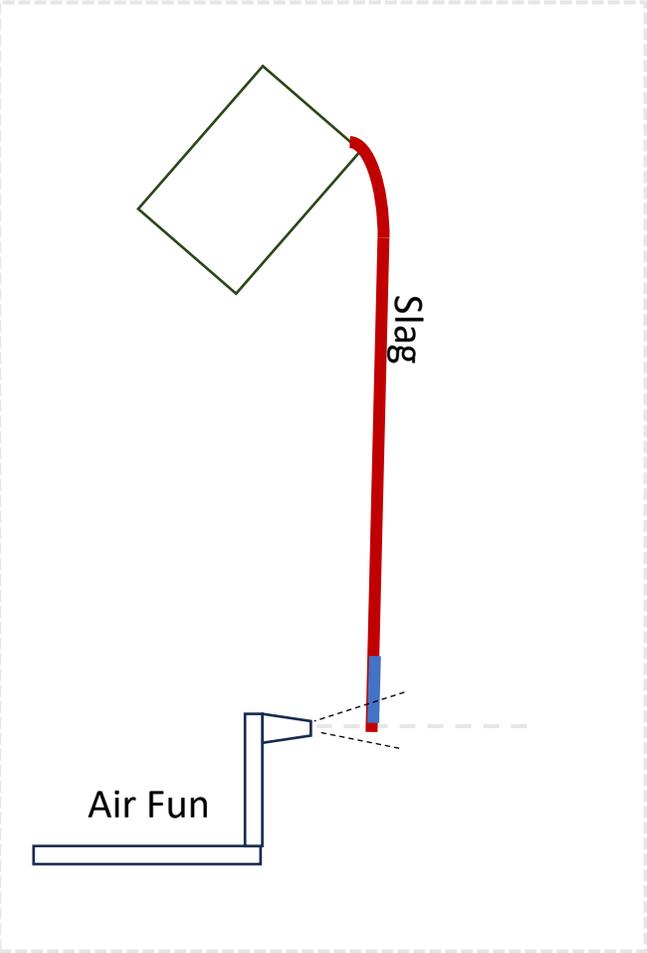

The system is described in a transient way by means of a multiphase model called VOF-to-DPM. The energy is enabled and the turbulence model used is the κ - ω SST.

VOF (Volume Of Fluid) – to – DPM (Discrete Phase Model)

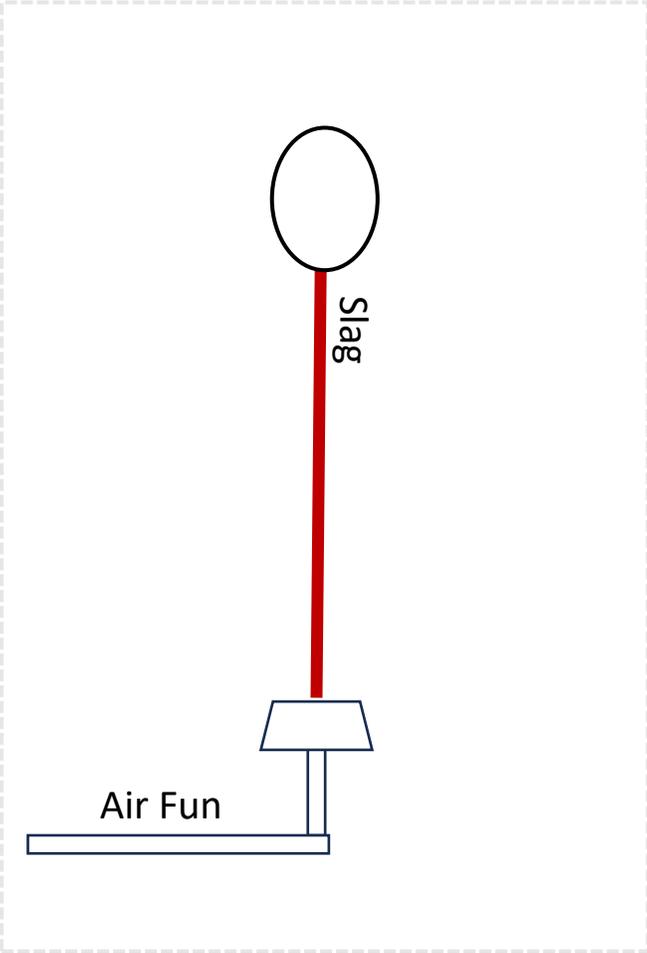

- ✓ Jet initial description (tracking liquid-gas interface)
- ✓ Capture instabilities and large structures formation (**primary breakup**)
- ✓ Explicit spray description from atomization to dispersion with a computationally intensive approach (*long* computation time)
- ✓ The **inputs are based on the process conditions** (such as the slag mass flow rate)
- ✓ The dispersion phase (**DPM**) consists in the **spherical droplets** formed during primary breakup
- ✓ **The output is the granulometry**, temperature and properties of the individual particles

Granulation Process – Geometry

Boundary Condition

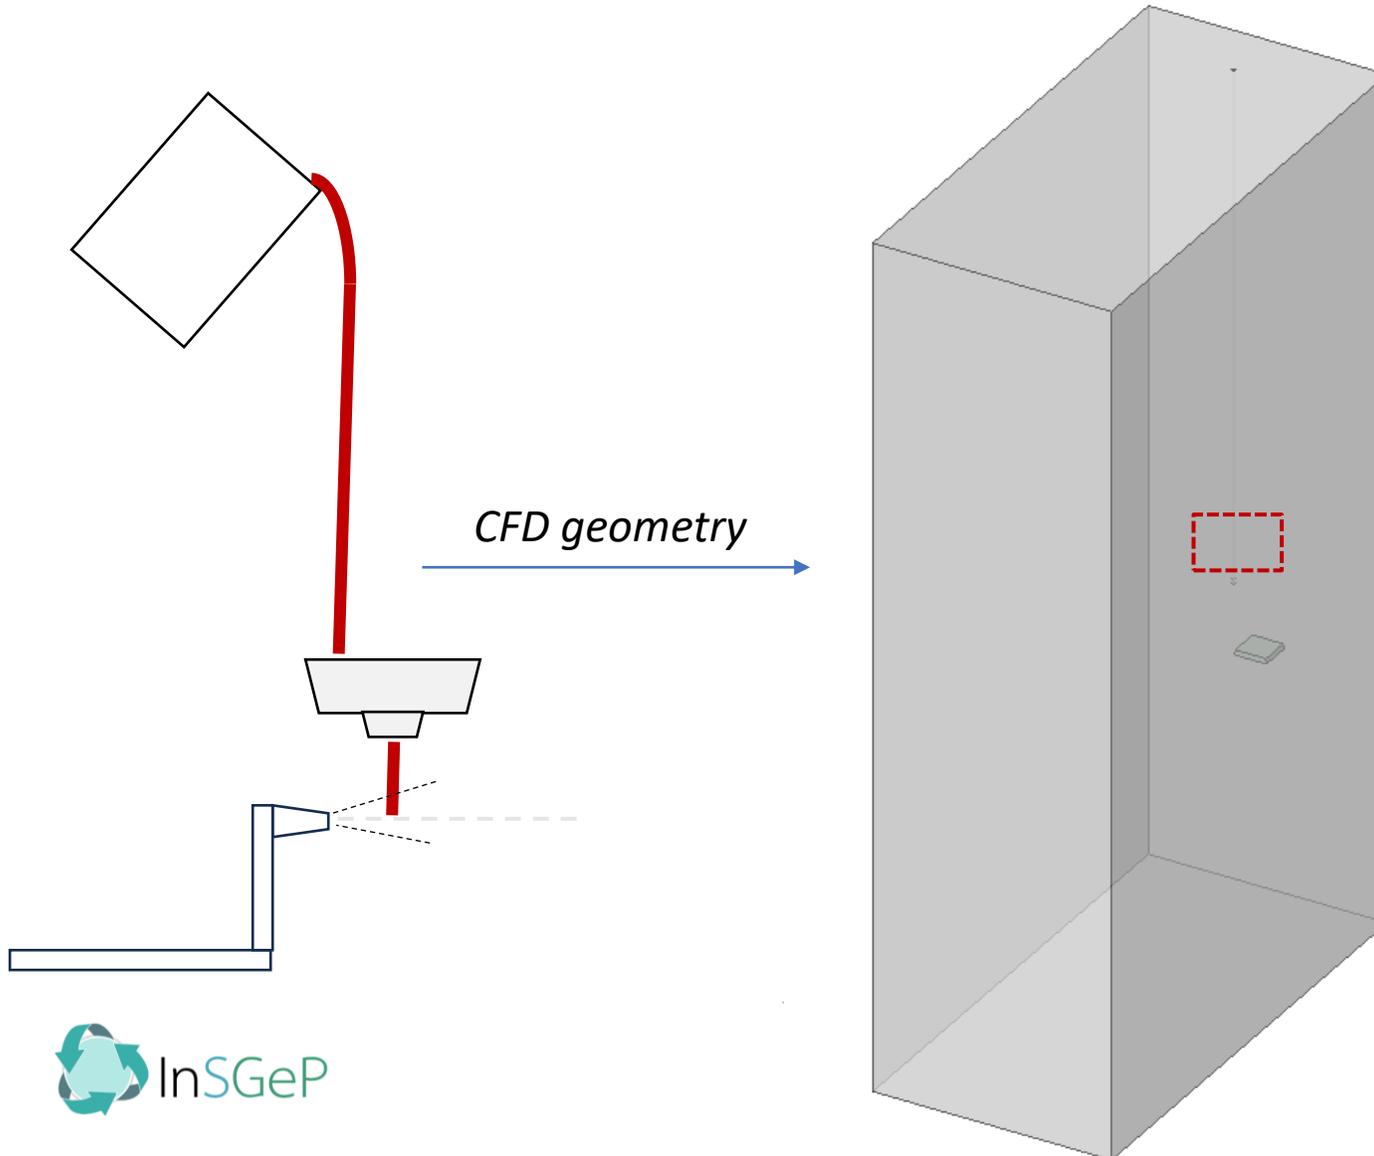

Simulation of the actual configuration

The CFD simulation with the CSM's geometry gives:

- a jet with a strong *instability* due to the distance between the point of slag release and the air nozzle
- The work conditions are *unusual* compared to the well know plant conditions

Simulation of New Configuration

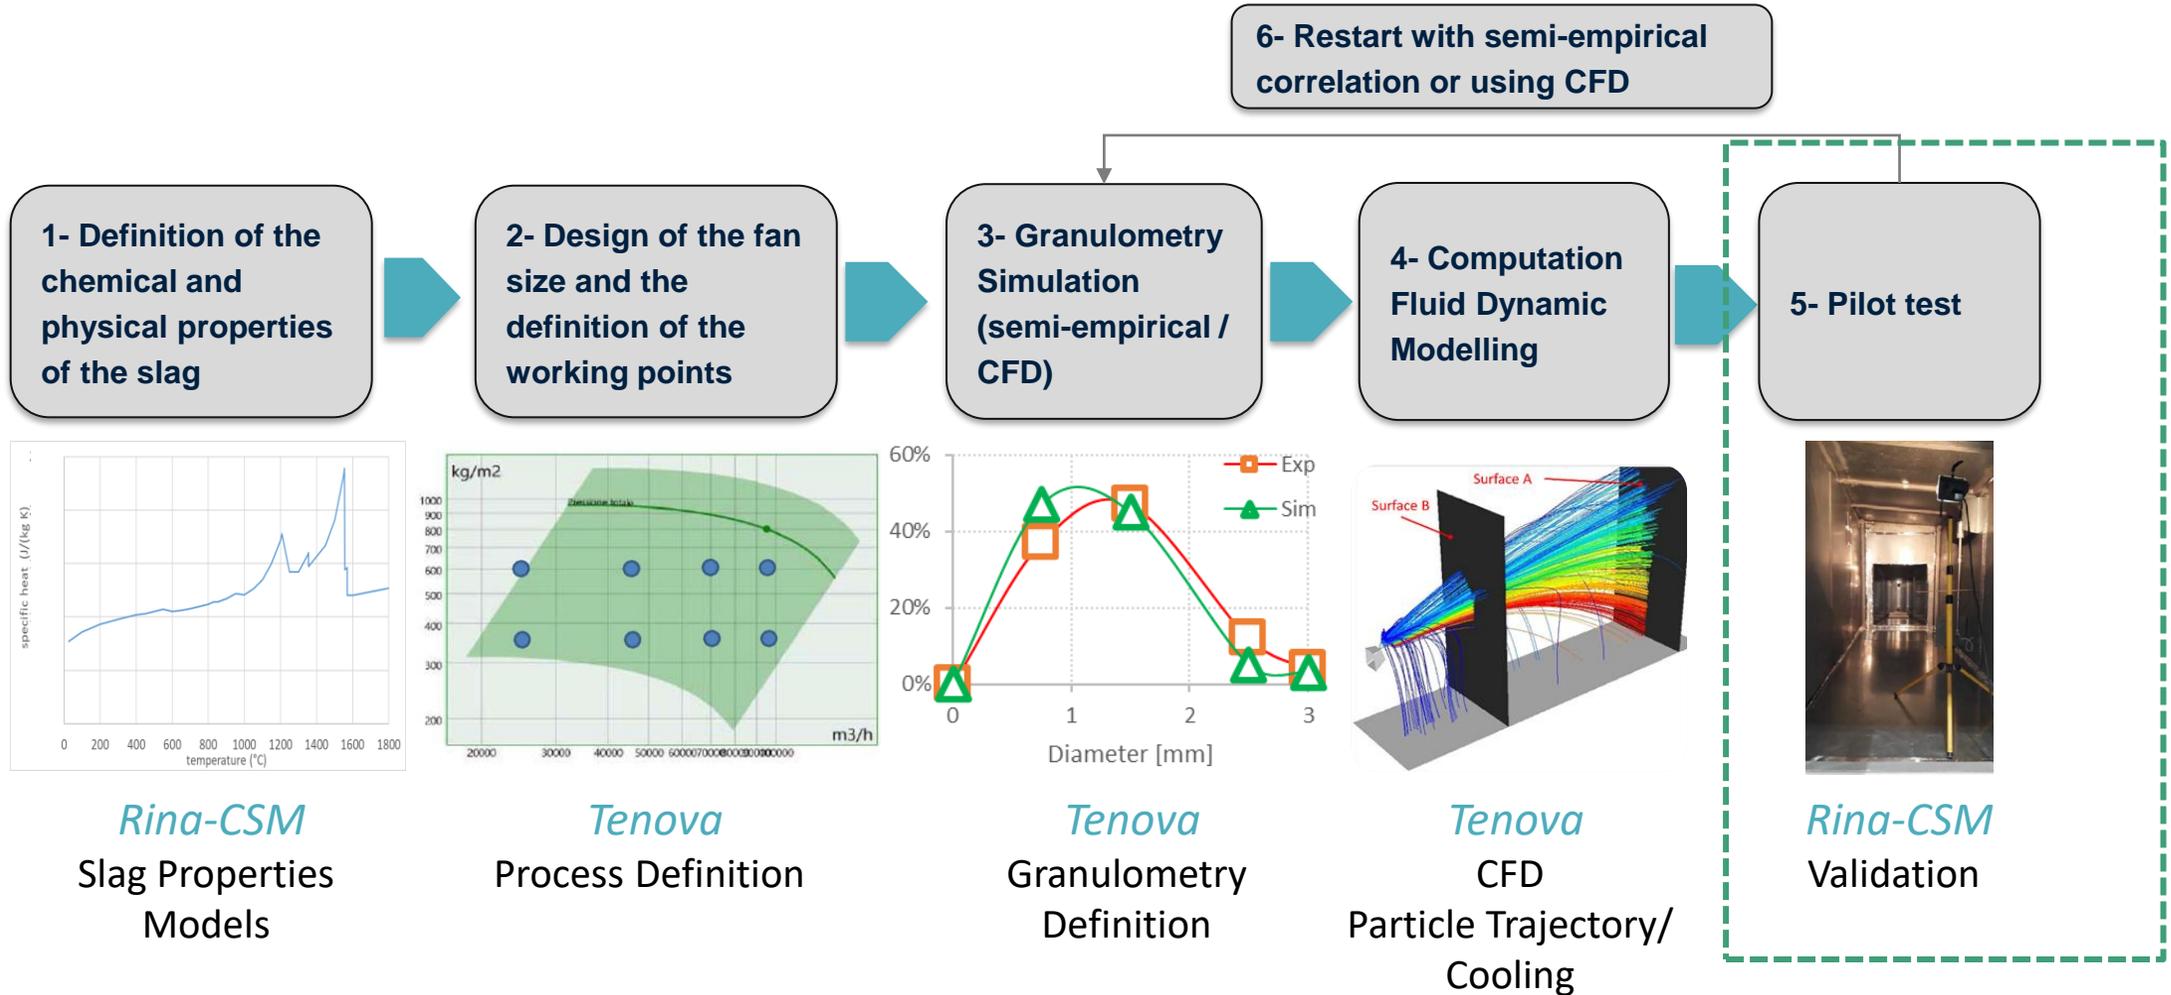

In order to be closer to the standard granulation conditions and to achieve a stable jet, a new plant configuration was proposed by CSM.

The main difference is the introduction of a '**slag tundish**' that allows to obtain a more stable jet with a higher diameter.

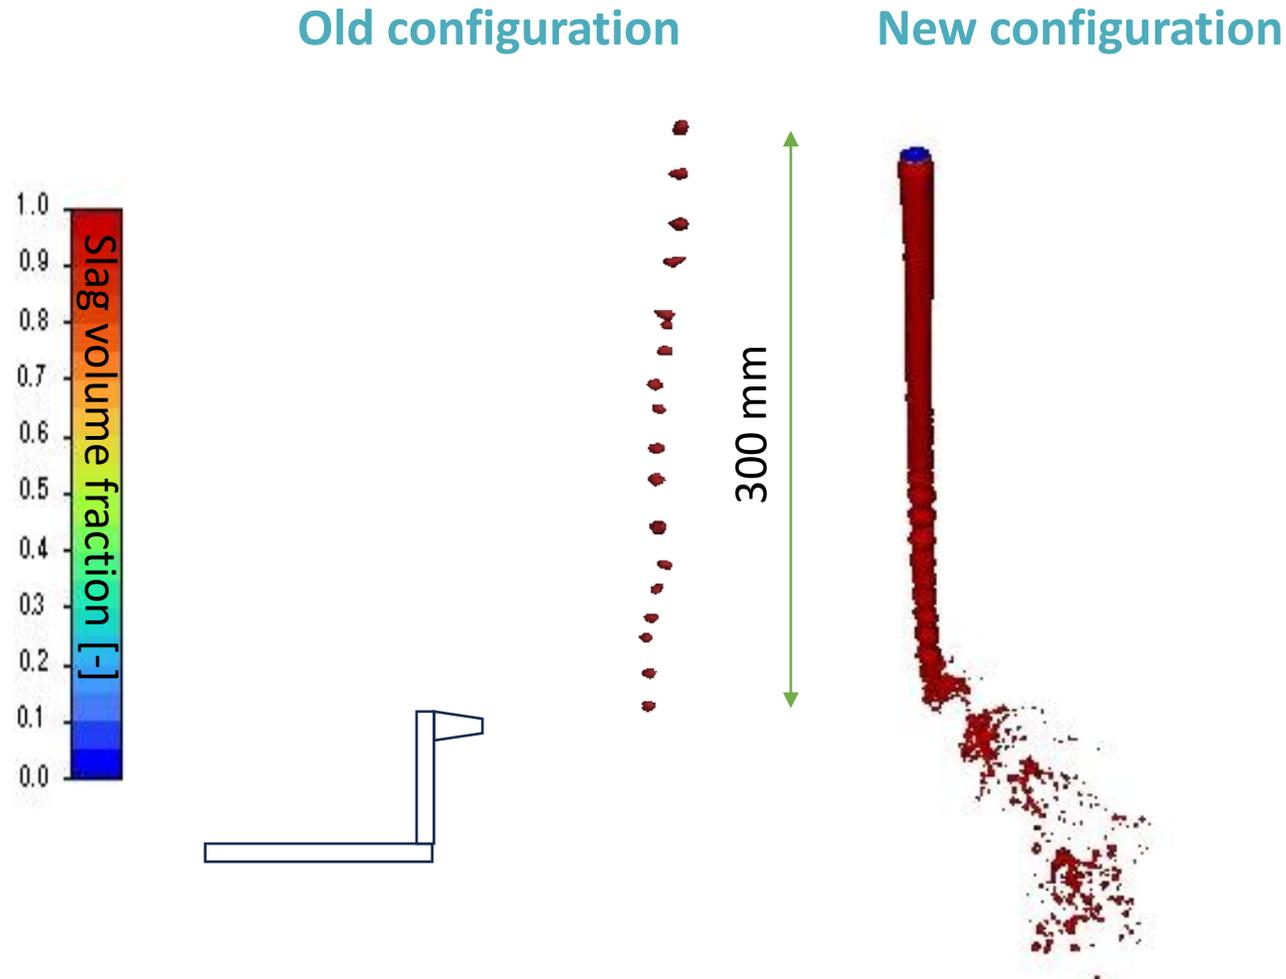

The CFD geometry is different by means:

- Position of the slag inlet
- Diameter of the slag inlet

Tenova Dry Slag Granulation Modelling

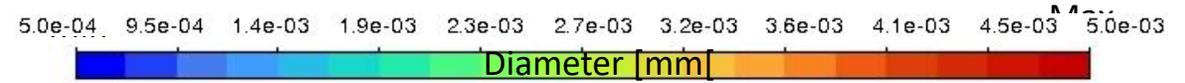

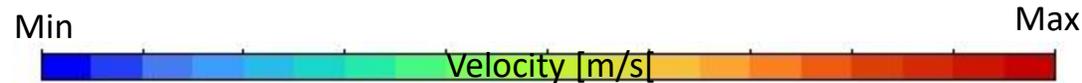

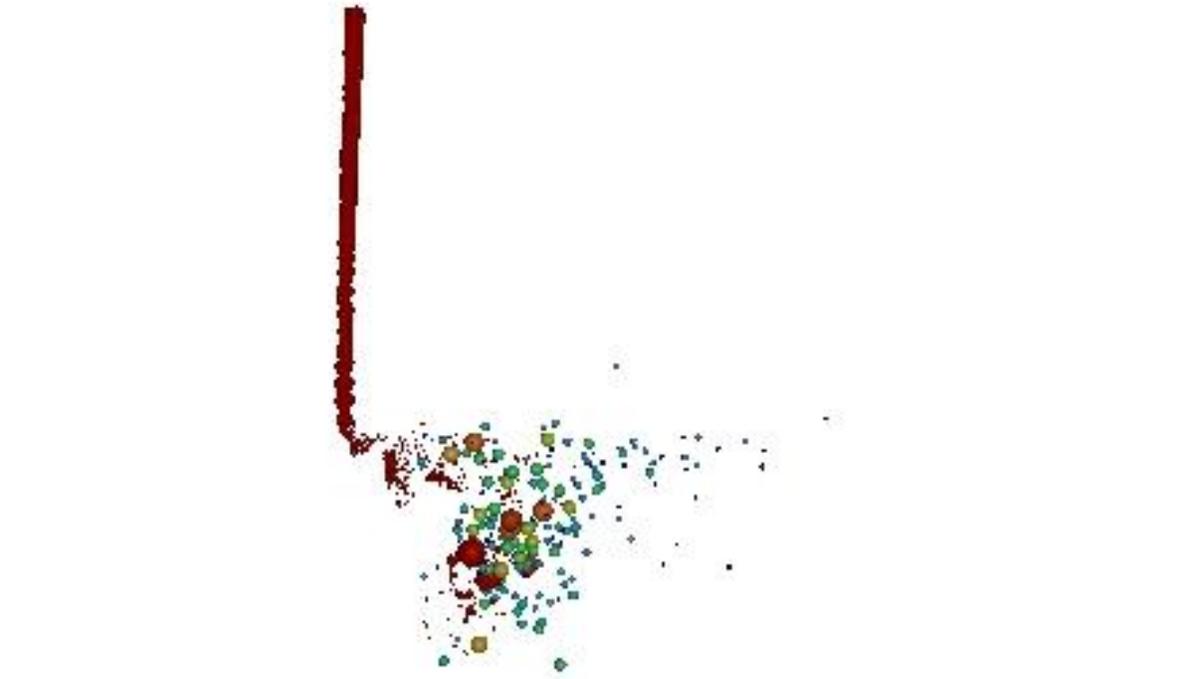

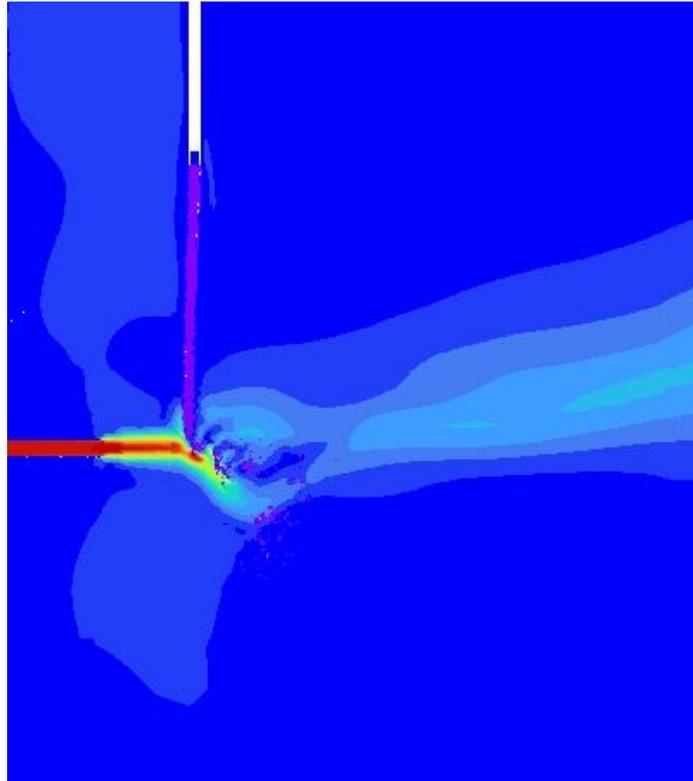

Simulation of New Configuration

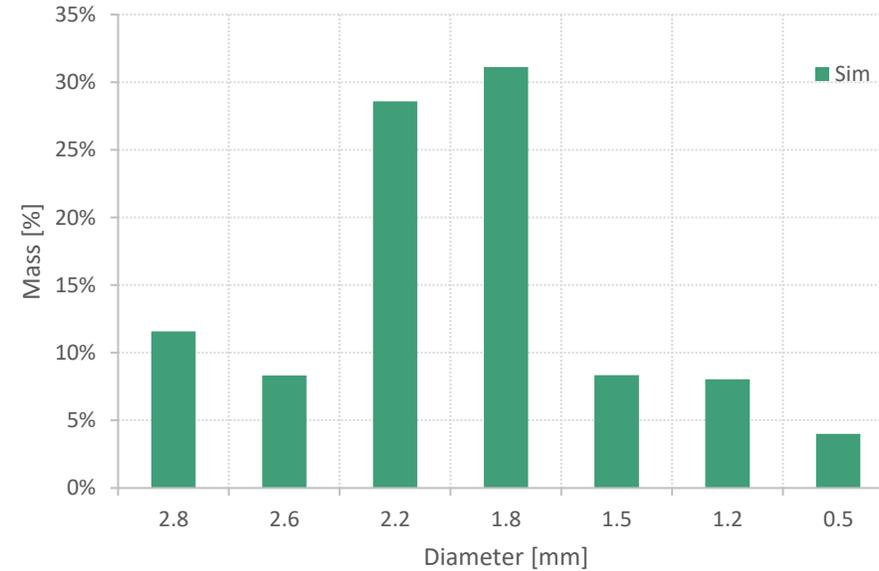

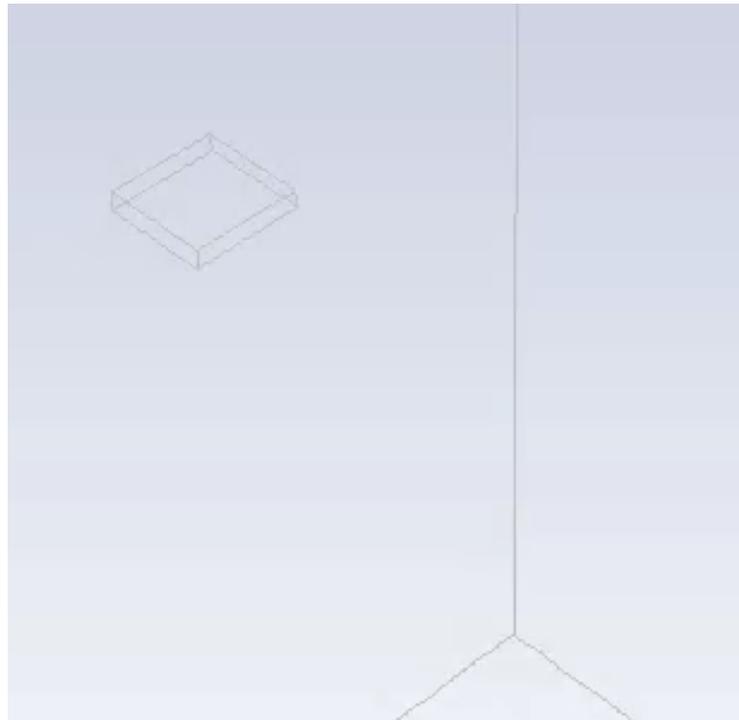

The CFD results confirm the success of the new configuration in terms of jet stability.

Simulation of New Configuration

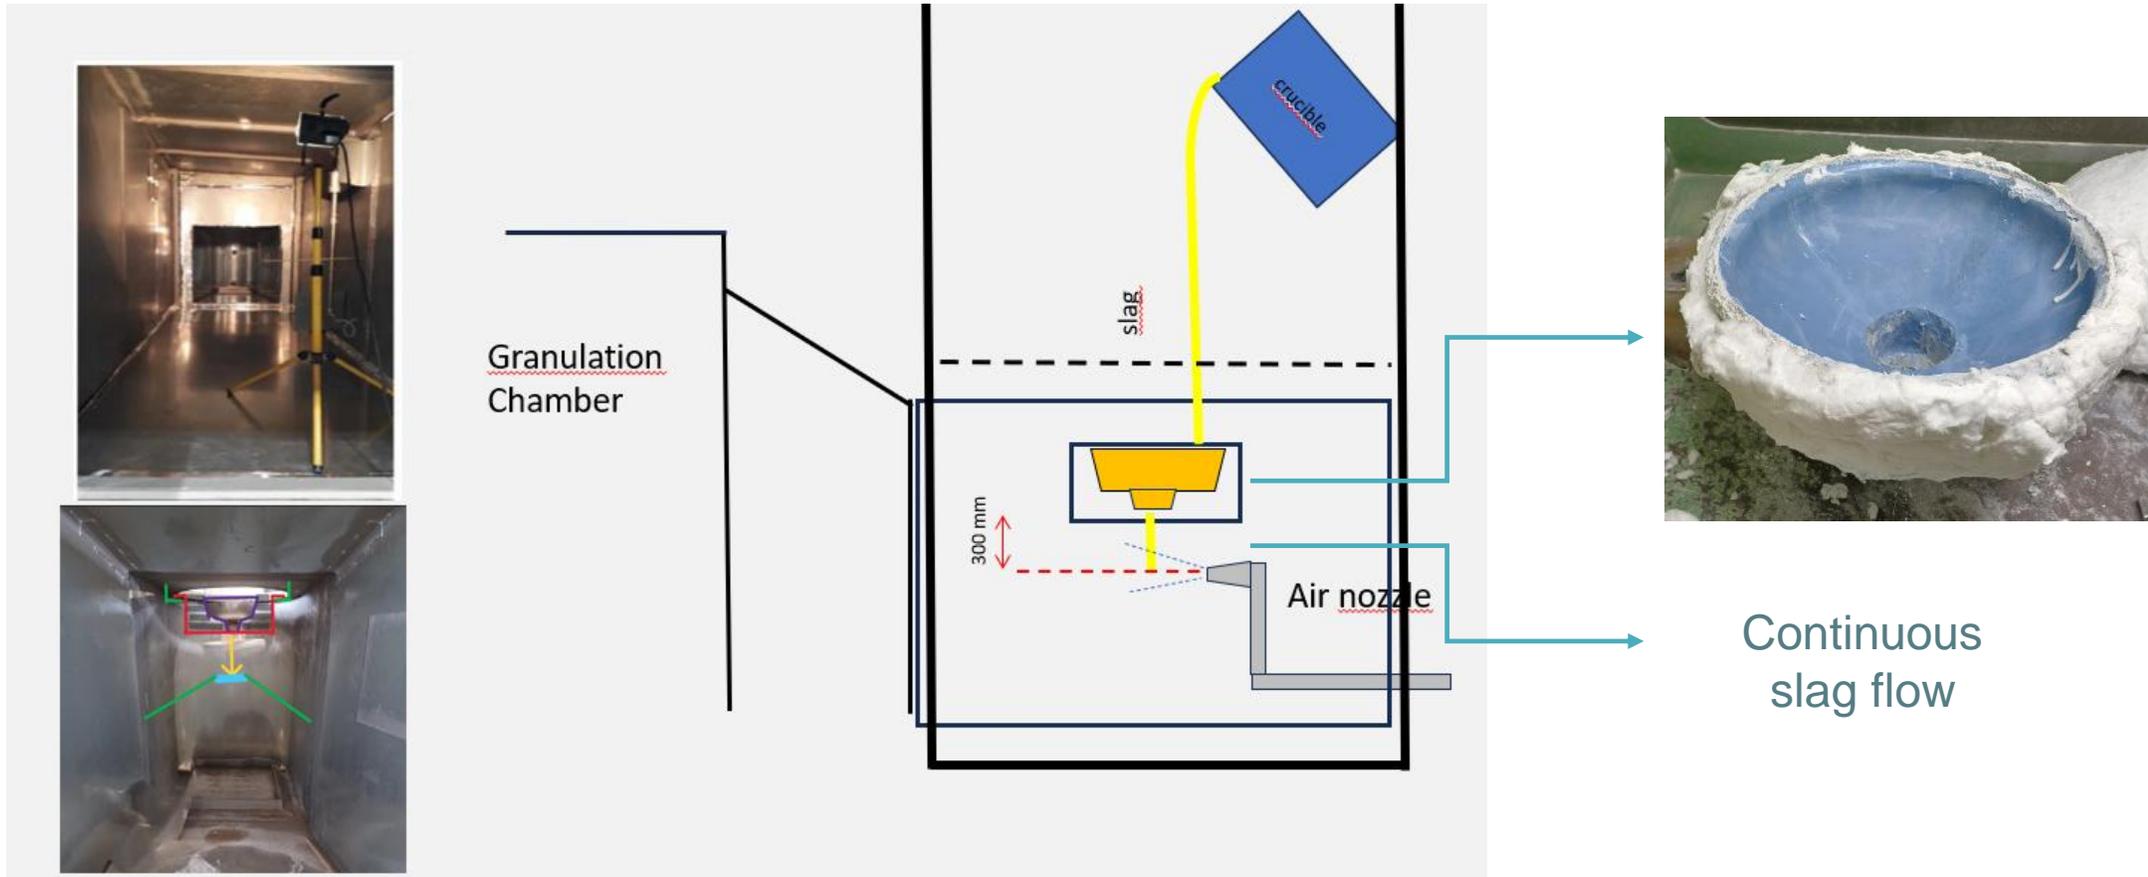

Simulation of New Configuration - RESULTS

Average diameter	
CFD	1.98 mm

Modification of Rina-CSM Pilot Plant

The pilot plant has been improved according to simulation carried out by Tenova

Granulation Test @ Rina-CSM Pilot Plant

Testing of dry slag granulation: 100% DRI

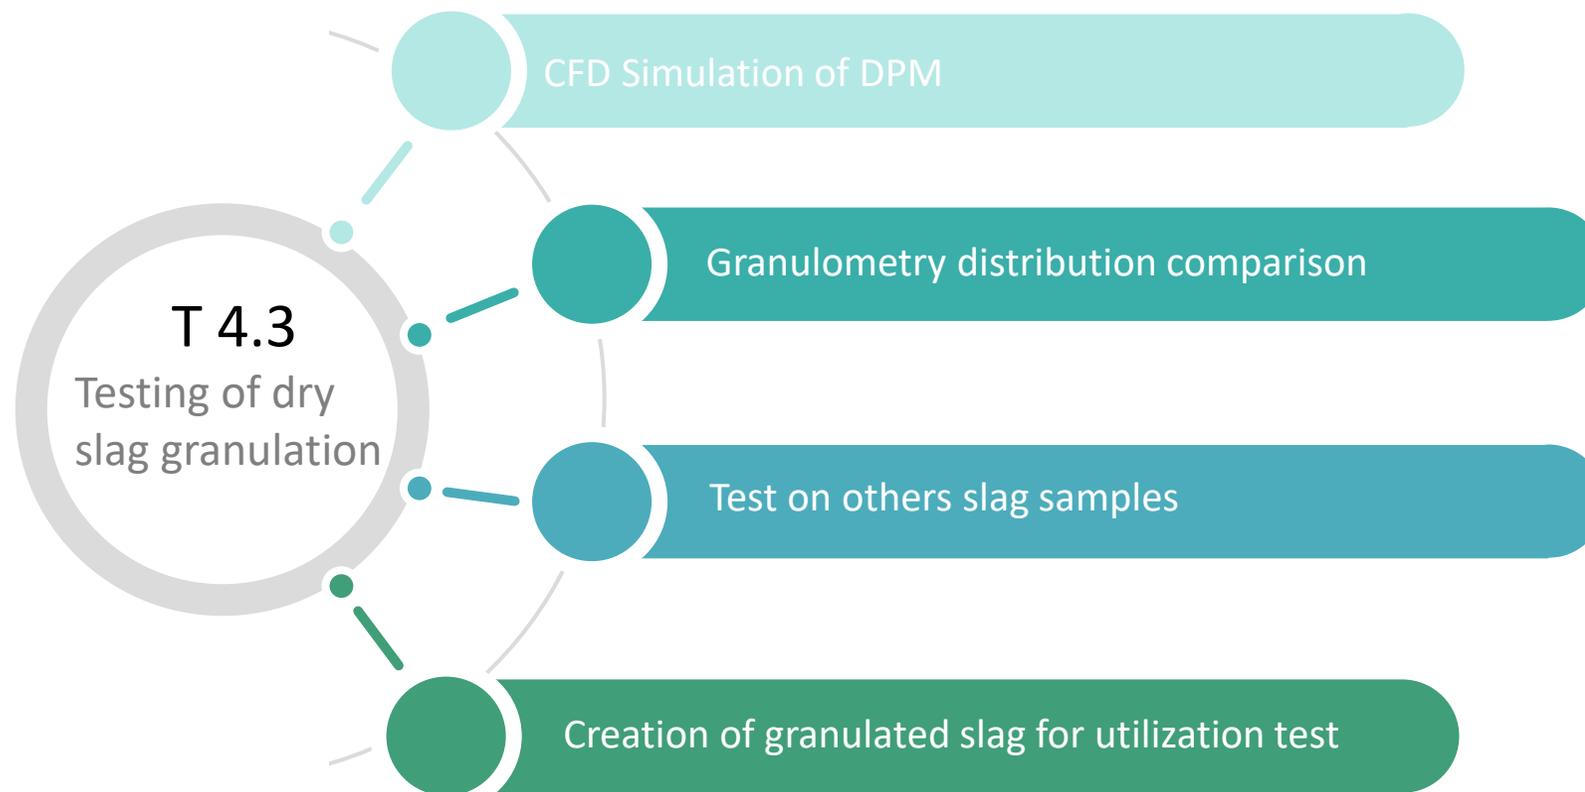

**Input quantity:
15 Kg di Fe+ 5 Kg slag**

Average diameter	
Exp	1.86 mm
CFD	1.98 mm
